- 2. “Next Generation” CO<sub>2</sub>-EOR**
- 3. Integrating CO<sub>2</sub>-EOR and CO<sub>2</sub> Storage**
- 4. Summary**

# 1. DOE BASIN STUDIES: CO<sub>2</sub>-EOR AND CO<sub>2</sub> STORAGE

Our company, Advanced Resources, recently completed a series of ten “basin studies” for DOE that address CO<sub>2</sub>-EOR and CO<sub>2</sub> storage.

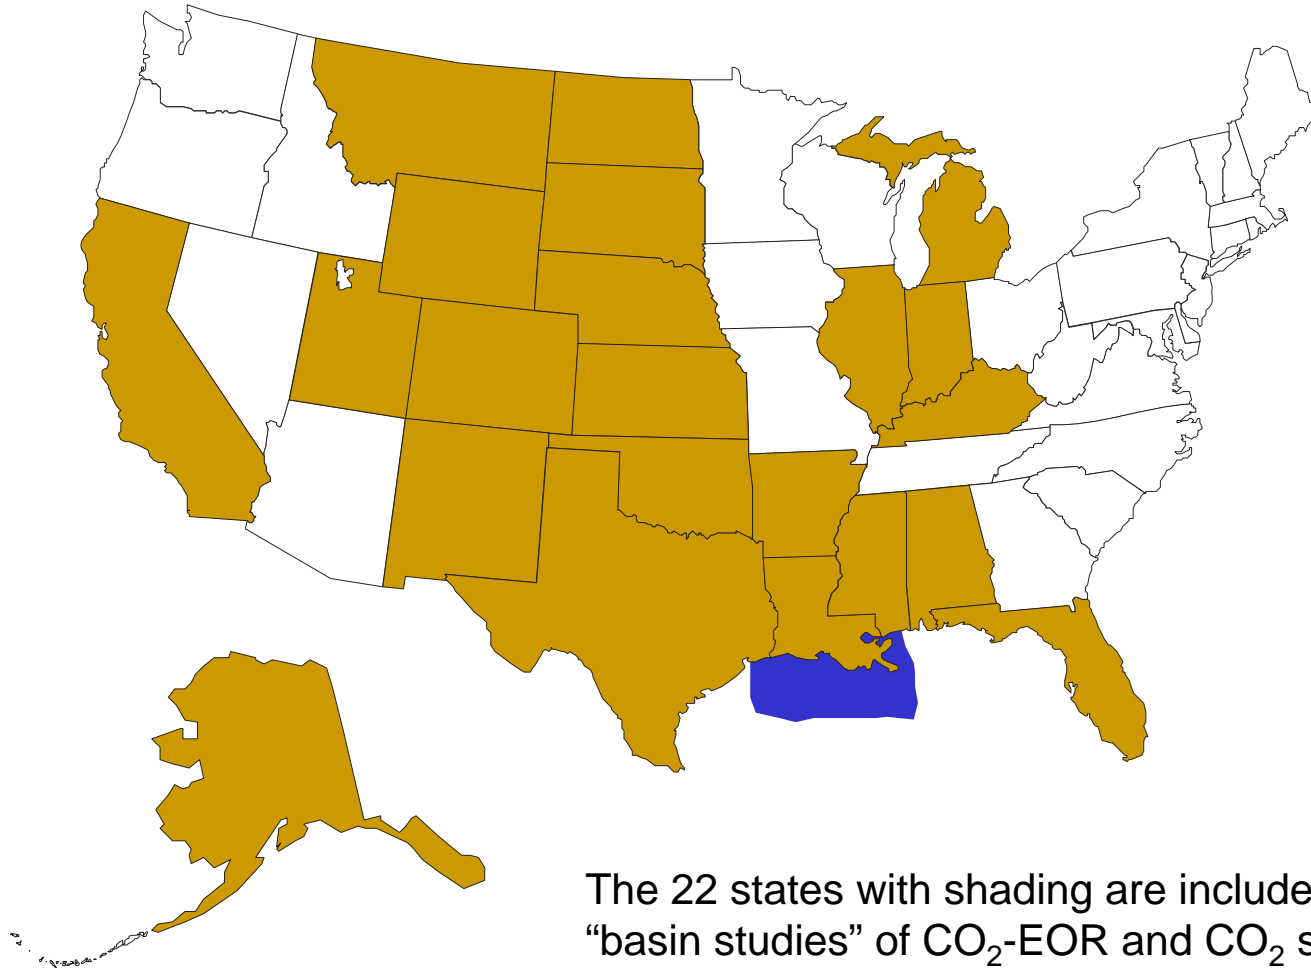

- Cover 22 of the oil producing states plus offshore Louisiana (shelf),
- Include 1,581 large (>50 MMBbls OOIP) oil reservoirs (two thirds of U.S. oil production),
- Estimate oil recovery and CO<sub>2</sub> storage using streamline reservoir simulation,
- Calculate economics using “industry standard” cash flow.

These reports are available on the U.S. Department of Energy’s web site at

[http://www.fe.doe.gov/programs/oilgas/eor/Ten\\_Basin-Oriented\\_CO2-EOR\\_Assessments.html](http://www.fe.doe.gov/programs/oilgas/eor/Ten_Basin-Oriented_CO2-EOR_Assessments.html)

# U.S. BASINS/REGIONS STUDIED FOR FUTURE OIL RECOVERY AND CO<sub>2</sub> SEQUESTRATION POTENTIAL FROM CO<sub>2</sub>-EOR

# DOE BASIN STUDIES: MEETING THE CONGRESSIONAL MANDATE

---

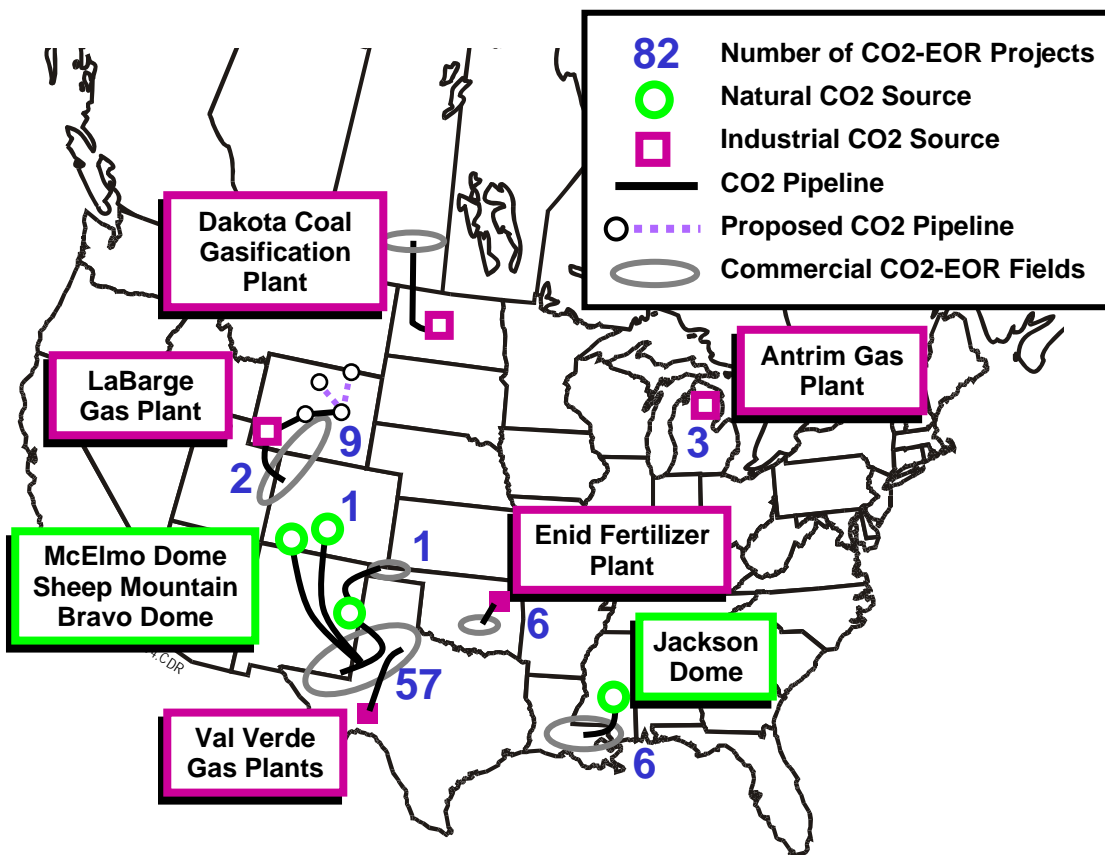

**The Congressional Budget language for FY2004 and FY2005 directed that “basin-oriented” assessments be conducted to “examine new steps to accelerate adoption of carbon dioxide-based enhanced oil recovery”.**

**The Congressional Budget language for FY2006 added emphasis on “productively using industrial sources of CO<sub>2</sub>.”**

***One DOE/FE step toward meeting this Congressional mandate has been to prepare a series of technical reports.***

# DOMESTIC CO<sub>2</sub>-EOR ACTIVITY

- Currently, 82 CO<sub>2</sub>-EOR projects provide 237,000 B/D of production
- Affordable natural CO<sub>2</sub> launched CO<sub>2</sub>-EOR activity in the 1980's
- Federal tax credits (Sec.43) and state severance tax relief still encourage CO<sub>2</sub>-EOR
- New CO<sub>2</sub>-EOR players:
  - OxyPermian (purchased Altura; adding new CO<sub>2</sub>-EOR projects)
  - KinderMorgan (providing CO<sub>2</sub> pipelines/supply; purchasing oil fields amenable to CO<sub>2</sub>-EOR)
  - Denbury (using Jackson Dome CO<sub>2</sub> for EOR in Mississippi and Louisiana)
  - Anadarko (using CO<sub>2</sub> from the LaBarge gas processing plant for EOR in the Rockies)

# GROWTH OF CO<sub>2</sub>-EOR PRODUCTION IN THE U.S.

# VOLUMES OF CO<sub>2</sub> INJECTED FOR EOR

State/ Province (storage location)	Source Type (location)	CO <sub>2</sub> Supply MMcfd	
		Geologic	Anthropogenic*
Texas-Utah- New Mexico	Geologic (Colorado-New Mexico) Gas Processing (Texas)	1,400	110
Colorado-Wyoming	Gas Processing (Wyoming)	0	240
Mississippi	Geologic (Mississippi)	100	0
Michigan	Ammonia Plant (Michigan)	0	2
Oklahoma	Fertilizer Plant (Oklahoma)	0	35
Saskatchewan	Coal Gasification (North Dakota)	0	145
<b>TOTAL</b>		<b>1,500</b>	<b>532</b>

# BASIN STUDIES: TECHNICALLY RECOVERABLE

**Nearly 89 billion barrels could become technically recoverable, providing a market for 20 billion metric tons of “EOR-Ready” CO<sub>2</sub>.**

**The economically recoverable portion depends on: (1) the “oil price” and market risk premium used for CO<sub>2</sub>-EOR investment decisions; (2) significant demonstrations of “state-of-the-art” CO<sub>2</sub>-EOR technologies to lower technical risk; and, (3) access to sufficient, low cost “EOR-Ready” CO<sub>2</sub> supplies.**

# TECHNICALLY RECOVERABLE RESOURCES: “STATE-OF-THE-ART” CO<sub>2</sub>-EOR (TEN BASINS/AREAS)

Basin/Area	DATABASE			ALL RESERVOIRS		
	Large Reservoirs			OOIP* (Billion Barrels)	ROIP** (Billion Barrels)	Technically Recoverable (Billion Barrels)
	# of Reservoirs	% of Resource	# Favorable For CO <sub>2</sub> -EOR

# BASIN STUDIES: ECONOMICALLY RECOVERABLE OIL

**From 4 to 47 billion barrels of domestic resource could be economically added to domestic oil supply with CO<sub>2</sub>-EOR technology.**

- “Traditionally practiced” CO<sub>2</sub>-EOR technology (small volumes of CO<sub>2</sub>, high technical risks) would enable only a modest portion, 4 billion barrels, of this CO<sub>2</sub>-EOR potential to be economic.<sup>1</sup>
- “State-of-the-art” CO<sub>2</sub>-EOR technology (larger volumes of CO<sub>2</sub>, modified injection design) plus lower technical and economic risks would make 24 billion barrels economically viable.<sup>2</sup>
- Availability of lower cost, “EOR-Ready” CO<sub>2</sub> supplies would increase the economically viable resource to nearly 47 billion barrels and accelerate the conversion of this resource to reserves and production.<sup>3</sup>

1. This case assumes an oil price of \$30 per barrel, a CO<sub>2</sub> cost of \$1.20 to \$1.50/Mcf, and a ROR hurdle rate of 25% (before tax).

2. This case assumes an oil price of \$30 per barrel, a CO<sub>2</sub> cost of \$1.20 to \$1.50/Mcf, and a ROR hurdle rate of 15% (before tax).

3. This case assumes an oil price of \$40 per barrel, a CO<sub>2</sub> cost of \$0.80/Mcf, and a ROR hurdle rate of 15% (before tax).

# ECONOMICALLY RECOVERABLE RESOURCES FROM CO<sub>2</sub>-EOR

# BASIN STUDIES: MARKET FOR PURCHASED CO<sub>2</sub>

The current U.S. market for “EOR-Ready” CO<sub>2</sub> is on the order of 10 to 20 billion metric tons of CO<sub>2</sub>. About 80% of this would become stored as part of CO<sub>2</sub>-EOR.

Currently known natural CO<sub>2</sub> sources hold only about 2 billion metric tons; CO<sub>2</sub>-EOR offers a major market for industrial CO<sub>2</sub>.

	Recoverable Oil	Purchased CO <sub>2</sub>		Stored CO <sub>2</sub>
	(Billion Barrels)	(Tcf)	(Billion Tonnes)	(Billion Tonnes)
Technically Recoverable	89	377	20	16
Economically Recoverable*	47	188	10	8

\* \$40 per bbl oil price, CO<sub>2</sub> cost of \$0.80/Mcf, ROR of 15% before tax.

# BASIN STUDIES: MARKET FOR PURCHASED CO<sub>2</sub>

## (TEN BASINS/AREAS)

Basin/Area	Technically Recoverable (Billion Barrels)	Purchased CO <sub>2</sub> (Tcf)
1. Alaska	12.4	51.4
2. California	5.2	23.9
3. Gulf Coast	6.9	33.3
4. Mid-Continent	11.8	36.3
5. Illinois/Michigan	1.5	5.7

## **2. “NEXT GENERATION” CO<sub>2</sub>-EOR TECHNOLOGY**

---

**Reservoir modeling and selected field tests show that high oil recovery efficiencies are possible using innovative applications of CO<sub>2</sub>-EOR.**

**Under ideal conditions, gravity-stable laboratory core floods have recovered essentially all of the residual oil.**

**Using horizontal wells (and other process designs) that facilitate contact of the reservoir’s pore volume with CO<sub>2</sub> would make high oil recovery efficiencies possible.**

**So far, except for a handful of cases, the actual performance of CO<sub>2</sub>-EOR in the field has been less than optimum, hampered by:**

- Geologically complex reservoir settings**
- Lack of “real time” performance information**
- Limited process control capacity**

# LIMITATIONS OF PAST PERFORMANCE

Because of high CO<sub>2</sub> costs and lack of information and process control, the great majority of past-CO<sub>2</sub> floods have used insufficient volumes of CO<sub>2</sub>.

Sweep Efficiency in Miscible Flooding

Source: Claridge, E.L., "Prediction of Recovery in Unstable Miscible Displacement", SPE (April 1972).

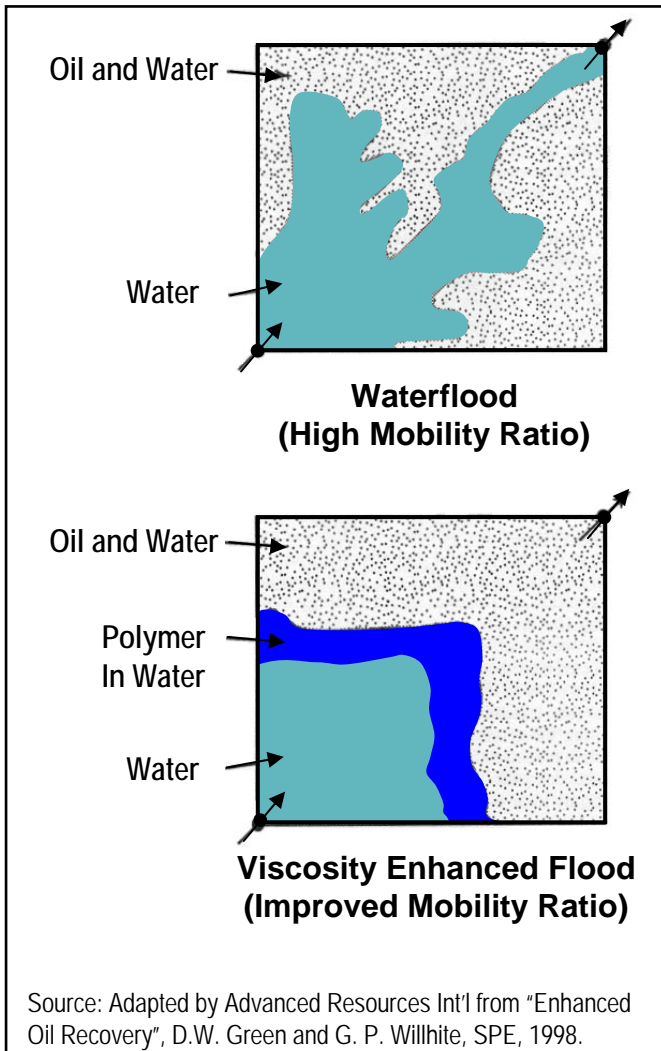

Injected CO<sub>2</sub> vs Oil Recovery

Source: SPE 24928 (1992)

# LIMITATIONS OF PAST PERFORMANCE

In many of the previous CO<sub>2</sub> floods, the injected CO<sub>2</sub> achieved only limited contact with the reservoir:

- Viscous fingering
- Gravity override

The figure shows how addition of viscosity enhancers could help improve reservoir contact.

# REVIEW OF PAST PERFORMANCE

Relative Location of the Water Front

**A major barrier is the inability to target the injected CO<sub>2</sub> to reservoir strata with high residual oil saturation.**

**The figures show: (1) the higher oil saturation and lower permeability portion of the reservoir is inefficiently swept; and (2) CO<sub>2</sub> channeling can be mitigated with well workover.**

Well 27-6 Injection Profile

Source: "SACROC Unit CO<sub>2</sub> Flood: Multidisciplinary Team Improves Reservoir Management and Decreases Operating Costs", J.T. Hawkins, et al., SPE Reservoir Engineering, August 1996.

### 3. INTEGRATING CO<sub>2</sub>-EOR AND CO<sub>2</sub> STORAGE

---

The volumes of CO<sub>2</sub> purchased for (and stored by) CO<sub>2</sub>-EOR in the ten “basin studies”, assume:

- The primary objective is enhancing economic oil recovery (minimizing costs while optimizing oil production).
- No economic value or benefit is placed on “permanently” storing CO<sub>2</sub>.
- CO<sub>2</sub>-EOR is applied as the tertiary (third) oil recovery option.

As such, the above CO<sub>2</sub> requirements and storage volumes represent a minimum. The question is - - *How and by how much could this minimum volume be expanded?*

### 3. INTEGRATING CO<sub>2</sub>-EOR AND CO<sub>2</sub> STORAGE (Cont'd)

---

**Expanding CO<sub>2</sub> Storage Capacity: A Case Study.** We use as the example a large Gulf Coast oil reservoir, with 340 million barrels (OOIP) in the main pay zone (above the producing oil-water contact).

This reservoir holds another 100 million barrels (OIP) in the underlying 130 feet of transition/residual oil zone and has an underlying saline reservoir 195 feet thick (within the spill point).

- Main Pay Zone:
  - Depth - - 14,000 feet
  - Oil Gravity - - 33°API
  - Porosity - - 29%
  - Net Pay - - 325 feet
  - Initial Pressure - - 6,620 psi
  - Miscibility Pressure - - 3,250 psi
- Primary/Secondary Oil Recovery: 153 million barrels (45% of OOIP, in MPZ)

This reservoir has 2,710 Bcf (143 million tonnes) of theoretical CO<sub>2</sub> storage capacity.

### 3. INTEGRATING CO<sub>2</sub>-EOR AND CO<sub>2</sub> STORAGE (Cont'd)

---

**State-of-the-Art.** First, this Gulf Coast oil reservoir is produced using “state-of-the-art” CO<sub>2</sub>-EOR project design - - vertical wells, 1 HCPV of CO<sub>2</sub> (purchased and recycled CO<sub>2</sub>), and a 1:1 WAG.

**“Next Generation”.** Next, this Gulf Coast oil reservoir is produced using “next generation” CO<sub>2</sub>-storage and CO<sub>2</sub>-EOR project design.

- Gravity-stable, vertical CO<sub>2</sub> injection with horizontal production wells.
- Targeting the main pay zone, plus the transition/residual oil zone and the underlying saline reservoir.
- Injecting continuous CO<sub>2</sub> (no water) and continuing to inject CO<sub>2</sub> after completion of oil recovery.
- Instituting a rigorous diagnostic and monitoring effort.

### 3. INTEGRATING CO<sub>2</sub>-EOR AND CO<sub>2</sub> STORAGE (Cont'd)

### 3. INTEGRATING CO<sub>2</sub>-EOR AND CO<sub>2</sub> STORAGE (Cont'd)

With “next generation” CO<sub>2</sub> storage and EOR design, much more CO<sub>2</sub> can be stored and more oil becomes potentially recoverable.

Importantly, the additional oil produced by “next generation” technology is “GREEN OIL”.

	“State of the Art”	“Next Generation”
	(millions)	(millions)
CO <sub>2</sub> Storage (tonnes)	19	109
Storage Capacity Utilization	13%	76%
Oil Recovery (barrels)	64	180
% Carbon Neutral (“Green Oil”)	80%	160%

However, considerable additional work is required to build this “next generation” technology and knowledge base for advanced CO<sub>2</sub>-EOR and CO<sub>2</sub> storage.

# Weyburn Enhanced Oil Recovery Project

## *(An Operating Project Maximizing Oil Recovery and CO<sub>2</sub> Storage)*

- Largest CO<sub>2</sub> EOR project in Canada:
  - OOIP 1.4 Bbbls
  - 155 Mbbls incremental
- Outstanding EOR response
- World's largest geological sequestration project
  - 2.4 MMt/year (current)
  - 7 MMt to date
  - 23 MMt with EOR
  - 55 MMt with EOR/sequestration

# “NEXT GENERATION” CO<sub>2</sub>-EOR AND CO<sub>2</sub> STORAGE

With advanced (“next generation”) CO<sub>2</sub>-EOR and CO<sub>2</sub> storage technologies, oil formations would have enough capacity to store much of the captured CO<sub>2</sub> in the near- to mid-term.

Regional considerations argue that all CO<sub>2</sub> storage options (oil & gas reservoirs, deep coal seams and saline formations) will be required.

# SUMMARY

Oil reservoirs have numerous attributes that make them attractive for storing CO<sub>2</sub> - - an established, secure trap; “value-added” products; and, existing infrastructure.

With “next generation” technology, that integrates CO<sub>2</sub> storage and oil recovery, a much greater portion of the available CO<sub>2</sub> storage capacity in oil reservoirs will become useable.

Plans are to provide a more sophisticated inclusion of this work in the updated version of NEMS, ready for AEO 2008.

- Linkage to levels of R&D investment
- Advanced technology levers
- Integration with sources of CO<sub>2</sub>.

A close-up photograph of a document, likely a report or spreadsheet, showing a table with numerical data. The numbers are slightly blurred but appear to be in two columns. The first column contains values like 40.6250, 57.7500, 29.5000, 78.2500, 77.2500, and 24.5000. The second column contains values like 1.1, 1.2, 1.3, 1.4, 1.5, and 1.6.
